AtliQo Bank Credit Card **Launch Strategy**

Business analytics project using customer transaction and credit profile data

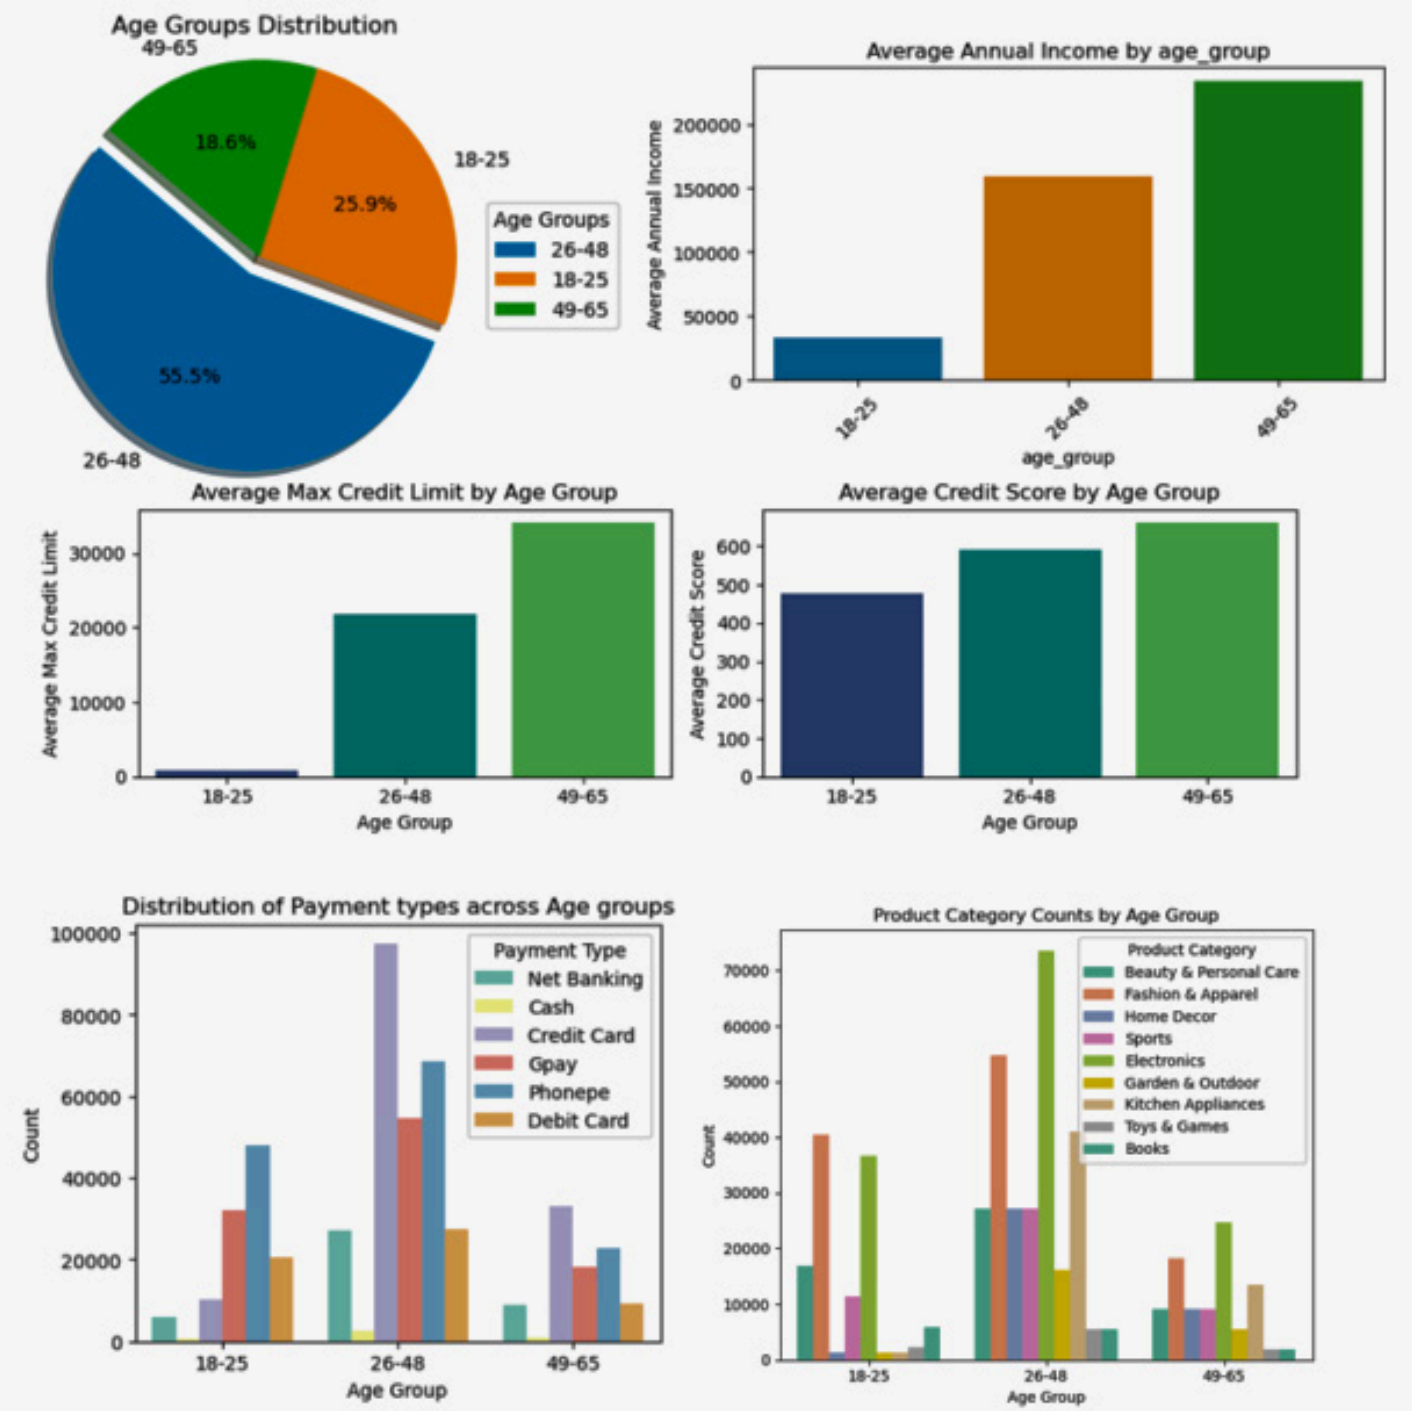
Buisness Problem:

- Identify the most suitable target segment for the new credit card launch
- Understand customer transaction and credit behavior
- Measure whether the campaign increased transaction activity

Customer Behaviour Analysis:



Key Customer Insights:

- Customers aged 26–48 represent the largest segment (55.5%) and show the highest transaction activity.
- Customers aged 49–65 demonstrate the strongest credit profile, with the highest income, credit score, and credit limit.
- Customers aged 18–25 show comparatively lower income and lower borrowing capacity.

Strategic Recommendations:

Primary Segment: 26–48 Age Group

- Largest share of customer base with 55.5% representation
- Demonstrates highest transaction activity and product engagement

Primary Segment: 26–48 Age Group

- Largest share of customer base with 55.5% representation
- Demonstrates highest transaction activity and product engagement

Secondary Segment: 49–65 Age Group

- Strongest credit profile with highest income and credit score
- Ideal for premium offerings due to superior financial capacity

Campaign Effectiveness:

- Applied a one-tailed two-sample z-test to assess impact. Compared mean transaction activity between groups
- H_0: Test group transactions ≤ control group
- H_1: Test group transactions > control group
- The post campaign z-test produced a p-value of 4.89×10^{-51}, which is far below the 5% significance level. Therefore, the null hypothesis is rejected, indicating that the campaign led to a statistically significant increase in transactions.

Primary Segment: 26–48 Age Group

- Largest share of customer base with **55.5%** representation
- Demonstrates highest transaction activity and product engagement

Recommendation: Prioritize the 26–48 segment for the initial AtliQo credit card launch.
